The article represents theoretical and methodological reasoning for the empirical study of socio-psychological well-being of children living in megalopolis. The problem of the research is pointed out as a combination of macro- and micro-social factors of megalopolis. The researchers suggest three-level factor system. The objective conditions of living in megalopolis include: area of living, type of buildings, quality of apartment, etc. Conditions of living subjectively perceived by people are connected to space and time organization of citizens daily activities. The research reveals the interconnection between autonomy of children, level of self-control formation, and conditions of living in megalopolis.

**Keywords:** socio-psychological well-being of children, megalopolis, early socialization of personality, factors of socio-psychological well-being.
